

Quarterly Infrastructure Report

This report summarizes platform capacity, notable changes, and planned work for the third quarter. It is intended for the infrastructure team and their partners in product engineering.

Overview

Total cluster capacity grew by 18 percent this quarter, driven mainly by the expansion of the eu-central-1 region. Request volume grew faster, at 26 percent, so average utilization rose despite the added hardware.

No customer-visible outages were recorded. Two internal incidents were raised, both resolved within the same working day, and neither breached the error budget.

Scope

The figures below cover managed compute only. Object storage, the data warehouse, and third-party services are reported separately and are out of scope for this document.

- Managed compute across all four production regions
- Scheduled batch workloads running on shared nodes
- Internal staging clusters, excluding developer sandboxes
- Reserved capacity held for failover

Capacity by Region

The table below shows node counts and average utilization for the final week of the quarter. Utilization is measured as mean CPU allocation during business hours.

Region	Nodes	Utilization	Status
us-east-1	48	72%	Healthy
us-west-2	32	64%	Healthy
eu-central-1	24	88%	At capacity
ap-south-1	16	41%	Underused

Next Steps

Three actions are proposed for the coming quarter, in priority order.

1. Add twelve nodes to eu-central-1 before the end of month one.
2. Migrate batch workloads off ap-south-1 and consolidate them in us-west-2.
3. Review reserved failover capacity, which has not been exercised in three quarters.

Questions and corrections should go to the platform team. A detailed cost breakdown is available on request.
